

Need to consolidate your IT? The solution is simple.

To meet ever increasing infrastructure demands, you need an enterprise storage system that can support your ever changing IT requirements. Integrating storage as part of your IT strategy will enable you to accommodate data growth, save power cooling and floor space, satisfy multiple needs—SAN, NAS, primary storage and secondary storage - with a single platform and maintain performance without investing in additional storage.

Businesses of all sizes are being required by law or company policy to save every piece of data — every e-mail, instant message, photograph, data sheet and spreadsheet and on the non-document side the law enforcement and private-security sectors with 24/7 security cameras are piling up enormous amounts of digital footage that must be retained and accessed.

Add to this the fact that high-definition video is steadily moving into the mix, taking up more space and bandwidth to store and access it, means even more storage will be necessary in the near future to handle the multiplicity of content

We can provide redundant storage solutions that offer unmatched business continuity and agility; superior application uptime; simplicity of management and breakthrough value for your business. Whether it's storage for virtualisation, standard files, video or graphics there's a storage solution to suit your business requirements and we will work with you to create a comprehensive portfolio of support and service tailored to meet the needs of your business.

A Virtual World

Server consolidation has become even more relevant thanks to technologies like Microsoft® Server 2008 Citrix Xen-Server and VMware Server™. These "virtual machine" resources enable you to consolidate server images on fewer hardware platforms to improve IT efficiency.

With so many options to choose from which one should you choose? Tecnica have a wealth of experience to help you choose the solution that best fits your business and as VMware, Citrix and Microsoft Partners we can provide you with the best solution at an affordable price.

VMware Infrastructure

VMware Infrastructure is used in a wide variety of environments and applications.

VMware Infrastructure provides built-in centralised management, application availability and operational automation capabilities that deliver transformative cost savings as well as increased operational efficiency, flexibility and IT service levels.

Citrix XenServer

The foundation of Citrix XenServer is the open source Xen hypervisor, a proven and robust virtualisation engine.

Combined with the performance, security and openness of Xen technology, with easy-to-use management and simplified deployment XenServer is perfect for rapid deployment of servers, server consolidation, development and test environments, and disaster recovery.

Windows Server 2008

With a half-dozen mouse clicks you can turn a single server into two servers. A few more mouse clicks and you've got three servers.

From the confines of one server box with a couple of processors, you can launch a file server, a web server, a server for collaboration and another for email. Five more mouse clicks and you can tell the server to create backups on a NAS device.
